

Equilibrium of Acids and Bases

James Melvin
MD candidate Yr2
BSc. Biochemistry

Table of contents

- Equilibrium
- Brønsted Lowry theory
- Buffers
- Bicarbonate system
- Quiz

Equilibrium

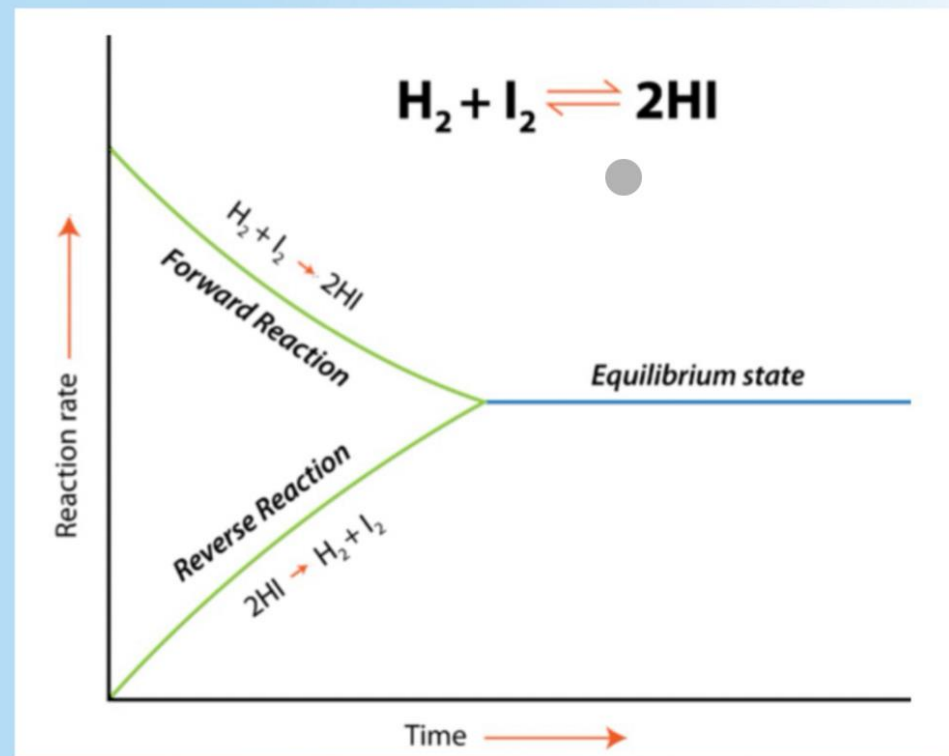

- Forward reaction rate = backward reaction rate
- No net change concentration, constant

Forward reaction: $\text{H}_2 (g) + \text{I}_2 (g) \rightarrow 2\text{HI} (g)$

Reverse reaction: $2\text{HI} (g) \rightarrow \text{H}_2 (g) + \text{I}_2 (g)$

- Only solutes and gases!

Equilibrium constant

- Ratio between the concentrations of the products and the concentrations of the reactants
- Expression: $aA + bB \rightleftharpoons cC + dD$

$$K_{\text{eq}} = \frac{[C]^c [D]^d}{[A]^a [B]^b}$$

Example from last slide:

$$K_{\text{eq}} = \frac{[\text{HI}]^2}{[\text{H}_2][\text{I}_2]}$$

Brønsted-Lowry Theory

Acid = proton (H⁺) donor

Base = proton (H⁺) acceptor

Acid → conjugate base

Base → conjugate acid

→ example: CH₃COOH (weak acid) / CH₃COO⁻ (weak conjugate base)

By the way...is water an acid or a base? It's amphoteric (both)

Key properties of water:

- 2 lone electron pairs
- **4 charge centers (2 bonding, 2 non-bonding)**
- Negative and positive dipole

Summary of Brønsted-Lowry and Lewis Theory on Water

Theory	Water as an Acid	Water as a Base
Brønsted-Lowry	Water donates a proton (H ⁺) to form OH ⁻ . Example: $\text{H}_2\text{O} + \text{NH}_3 \rightarrow \text{OH}^- + \text{NH}_4^+$.	Water accepts a proton (H ⁺) to form H ₃ O ⁺ . Example: $\text{HCl} + \text{H}_2\text{O} \rightarrow \text{H}_3\text{O}^+ + \text{Cl}^-$.
Lewis Theory	Water acts as a Lewis acid by accepting an electron pair. Example: $\text{Cu}^{2+} + 4\text{H}_2\text{O} \rightarrow [\text{Cu}(\text{H}_2\text{O})_4]^{2+}$.	Water acts as a Lewis base by donating an electron pair. Example: $\text{H}^+ + \text{H}_2\text{O} \rightarrow \text{H}_3\text{O}^+$.

Disassociation

- K_a/K_b - measurement of the ability of the acid/base have to donate/accept protons

Acid expression:

$$K_a = \frac{[A^-][H^+]}{[HA]}$$

Base expression:

$$K_b = \frac{[HB^+][OH^-]}{[B]}$$

Strong acid/base: high K_a/K_b

Weak acid/base: low K_a/K_b

Formulas to remember

$$pH + pOH = 14$$

pH of strong acid

$$pH = -\log [H^+]$$

pOH of strong base

$$pOH = -\log [OH^-]$$

pH of weak acid

$$pH = -\log \sqrt{K_a \times C_a}$$

pOH of weak base

$$pOH = -\log \sqrt{K_b \times C_b}$$

The pH of a 0.001M solution of NaOH is equal to?

1. The pH of 0.001 M NaOH solution equals to: A. 13 B. 11 C. 7 D. 4 E. 3

$$[\text{OH}^-] = 0,001 \text{ M}$$

$$\begin{aligned} \text{pOH} &= -\log [\text{OH}^-] \\ &= -\log (0,001) \end{aligned}$$

$$\text{pH} + \text{pOH} = 14$$

$$\underline{\text{pOH} = 3}$$

$$\text{pH} + 3 = 14$$

$$\underline{\underline{\text{pH} = 11}}$$

Buffers - concept

- Solution with a weak acid/conjugate base or weak base/conjugate acid
- Ability to resist changes in pH when acid or base is added
- UWAGA: physiological buffers in our body!
- Henderson-Hasselbach equation:

$$\text{pH} = \text{p}K_a + \log \frac{[\text{base}]}{[\text{acid}]}$$

Buffers

- Buffer concentration = $C_a + C_b$
- Buffer capacity = quantity of strong acid/base that must be added to change the pH of 1L of the solution by one pH unit
- → more concentrated = larger capacity to resist change

$$\beta = \frac{\Delta n}{\Delta pH}$$

n – moles added of H⁺ / OH⁻ to 1L buffer
change caused by the addition

- Buffer range = pKa +/- 1

6. What is the pH of acetate buffer containing 0.05 moles of acetic acid (CH_3COOH) and 0.09 moles of sodium acetate (CH_3COONa) in 2L of buffer? What is the buffer concentration? What would be the change in pH if 1 mL of 8M NaOH was added to above buffer? For acetic acid $K_a = 1.75 \times 10^{-5}$. What is the buffer capacity towards bases?

① Calculate pH of the buffer

① HH equation

$$\text{pH} = \text{pK}_a + \log \frac{[\text{A}^-]}{[\text{HA}]}$$

$$K_a = 1.75 \times 10^{-5}$$

$$\text{pK}_a = -\log K_a = -\log (1.75 \times 10^{-5})$$
$$\approx 4.76$$

② Calculate concentrations of w. acid (HA) and w. conjugate base (A⁻)

<u>HA</u>	<u>A⁻</u>
$M = \frac{\text{mol}}{\text{vol (L)}}$ (mol/L)	$M = \frac{\text{mol}}{\text{vol (L)}}$ (mol/L)
$M = \frac{0.05 \text{ mol}}{2 \text{ L}}$	$= \frac{0.09 \text{ mol}}{2 \text{ L}}$
$m = 0.025 \text{ mol/L}$	$= 0.045 \text{ M}$

③ Plug missing values back into HH to solve equation

$$\text{pH} = 4.76 + \log \frac{(0.045)}{(0.025)}$$

$$= 4.76 + 0.26$$

$$= 5.02$$

Buffer Concentration

Buffer concentration = total concentration of buffer components
already calculated conc. of w. acid + w. conj. base (see prev. step)

$$\begin{aligned}\text{Buffer concentration} &= 0.025 \text{ M} + 0.045 \text{ M} \\ &= 0.07 \text{ M}\end{aligned}$$

Change in pH after adding 1ml of NaOH

NaOH (strong base) will react w/ the w. base and increase the moles of conj. base. On the other hand NaOH will react w/ the w. acid and decrease its moles.

New total moles of base:

moles of NaOH + moles of conj. base (already calculated in 1st step)

moles of NaOH

$$8M \text{ NaOH} = \frac{8 \text{ mol NaOH}}{L} \times \frac{L}{1000 \text{ ml}} = 0.008 \text{ mol NaOH}$$

Total moles of base (A⁻)

$$\begin{aligned} A^- &= 0.09 \text{ mol} + 0.008 \text{ mol} \\ &= 0.098 \text{ mol} \end{aligned}$$

Total moles of acid (HA)

$$\begin{aligned} HA &= 0.05 \text{ mol} - 0.008 \\ &= 0.042 \text{ mol} \end{aligned}$$

With new values calculate the change in pH when 0.008 mol NaOH is added

$$\begin{aligned} \text{pH} = \text{pH} &= \text{pK}_a + \log \frac{[\text{A}^-]}{[\text{HA}]} \\ &= 4.76 + \log \left(\frac{0.048 \text{ mol}}{2 \text{ L}} \right) \\ &\quad \left(\frac{0.042 \text{ mol}}{2 \text{ L}} \right) \\ &= 4.76 + \log (2.333) \\ &= 4.76 + 0.37 \end{aligned}$$

$$\text{New pH} = 5.13$$

Calculate change in pH before and after NaOH was added (ΔpH)

$$\begin{aligned} \Delta \text{pH} &= 5.13 - 5.02 \\ &= 0.11 \end{aligned}$$

Buffer Capacity towards bases

$$\begin{aligned} \beta &= \frac{\Delta n \text{ (moles of strong base added)}}{\Delta \text{pH} \times \text{Vol (L)}} \\ &= \frac{0.08}{0.11 \times 2 \text{ L}} \\ &= 0.036 \text{ mol/L per pH unit} \end{aligned}$$

Physiological buffers - bicarbonate system

- Maintain pH in blood → metabolic function

- Excess H^+ → CO_2 exhales
- Dec. H^+ → Shifts to right

Important Normal Values on ABG

pH	7.35 - 7.45
pCO ₂	35 mmHg - 45 mmHg
pO ₂	75 mmHg - 100 mmHg
HCO ₃ ⁻	22 mEq/L - 26 mEq/L
O ₂ Sat	Greater than 95%
